The variety of rice that dominated South Carolina's commercial production; a long-grain type named for the color of the plant in the fields at harvest time

The large wooden vessel used for pounding rice

Pounding tool used in beating rice

Tool used to separate rice from the stalk

A wide, round, shallow basket used to "fan" or separate rice kernels from the hulls after pounding; fanner baskets are nowadays made of sweetgrass though originally they were made using rushes, a heavier material more suited to a work basket

The process of removing the tough outer cuticle or hull from rice grains with a mortar and pestle

The technique of removing the layer of bran from freshly beaten rice using a mortar and pestle; bran is nutritious but apt to spoil during long storage.

Rice with the hull still on; on a plantation without a pounding mill, rice was often sold as rough rice

Sickle used to harvest rice

The flood-gate system devised for tidal-irrigated rice fields
